

AERIS Reviewer Overview

WHAT AERIS IS

AERIS is a workplace point-of-sale (POS) client for small retail businesses already running an AERIS workspace. The mobile app is a satellite for sales staff and managers: scan products, build a cart, take payment, look up customers, view past transactions, and process refunds. The five core surfaces are native iOS; an optional ERP tab (hidden by default) wraps the merchant's own admin web UI.

Accounts cannot be created in-app. AERIS workspaces are provisioned on the AERIS platform by the business owner; staff are added by the workspace administrator. The mobile app only signs into an existing workspace.

TEST WORKSPACE

Sign-in credentials are provided in the App Review Information field. The demo workspace is pre-seeded with sample products, customers, and recent transactions. No real-money payment is taken; the Cash tender is a recorded sale only.

To test the barcode scanner: the demo workspace has no real-world barcode pre-assigned, so before you scan, open any product (Items tab → tap a product), tap *Edit*, scan or type any barcode you have to hand into the *Barcode* field (the back of a snack packet, library book, or a generated barcode on screen all work), and tap *Save*. You can now scan that same barcode from the Items tab search row or from Quick Sale to look the product up.

PERMISSIONS

PERMISSION	INFO.PLIST KEY	USED FOR
Camera	NSCameraUsageDescription	Barcode scanning. Frames consumed in-process by vision-camera; never stored, transmitted, or shared.
Face ID	NSFaceIDUsageDescription	Biometric unlock for the local PIN. Authentication is local; no biometric data leaves the device.
Local Network	NSLocalNetworkUsageDescription	Direct mode (opt-in) for on-premises deployments. Cloud relay is the default.

Not used: microphone (explicitly disabled in vision-camera config), photo library, contacts, location, motion, Bluetooth, calendar, reminders.

COMPLIANCE SUMMARY

TOPIC	STATUS
Account creation	Not in-app. Workspace-administrator-provisioned only; no sign-up screen exists.
Account deletion (5.1.1(v))	Settings → <i>Remove account from this device</i> wipes local credentials + cache. Full account deletion is administrator-mediated per 5.1.1(v) sentence 2 (in-app creation is unsupported).
Payments (3.1.3(a))	Physical-goods retail POS exemption. App records sales taken in person by the merchant. No IAP, no digital content, no subscriptions in-app.
Encryption export	ITSAAppUsesNonExemptEncryption: false . Uses iOS Keychain, HTTPS, expo-crypto UUIDs only.
ATS exception	Narrow: NSAllowsLocalNetworking + aeris.local for on-premises LAN deployments. Cloud relay uses HTTPS (https://api.aeris.team).
Privacy manifest	Present. NSPrivacyTracking: false ; no analytics, no ads, no IDFA, no cross-app identifiers. Reasons declared for UserDefaults / FileTimestamp / BootTime / DiskSpace.
Sign in with Apple (4.8)	N/A. No third-party SSO offered.
Background modes	None declared.

AERIS How to test

GOLDEN PATH: FULL SALE + REFUND

1. **Launch** → splash transitions to Login.
2. **Sign in** using the credentials provided in App Review Information. You land on the Dashboard with today's sample numbers.
3. **Scan a product:** Items tab → tap the barcode icon in the search row → camera opens. Point at any EAN-13 or Code-128 barcode (sample SKU + barcode in the demo workspace notes). On match, the product detail opens.
4. **Build a sale:** Sale tab → tap product tiles to add → tap the cart icon → tap *Checkout*.
5. **Take payment:** Choose *Cash* → enter any amount ≥ total → tap *Complete Sale*. A receipt screen appears.
6. **View it:** Transactions tab → tap the new sale at the top. You'll see items, payments, and customer.
7. **Refund:** tap *Refund* on the sale detail → choose *By amount* → enter an amount ≤ sale total → enter a reason → confirm. The sale's *Refunds* card updates inline with a Net Total below.

TEST THE "REMOVE FROM THIS DEVICE" FLOW (5.1.1(V))

1. From any screen, tap the gear icon (top right) → scroll to **Danger zone**.
2. Tap **Remove account from this device**. A destructive iOS alert appears.
3. Tap **Remove**. The app signs you out and returns to Login. The server account is unaffected.

Why this is device-only: AERIS accounts are administrator-provisioned (see "Account creation" above). Apple Guideline 5.1.1(v) requires in-app account deletion only when accounts can be created in-app, which AERIS does not. The in-app action is deliberately device-scoped: it clears the sign-in, PIN, biometric preference, cached workspace catalogue, and named cashier sessions. Permanent account deletion is administrator-mediated, as stated in the helper text above the button.

OTHER SURFACES A REVIEWER MAY NOTICE

SURFACE	NOTES
WebView (ERP tab)	Hidden by default behind a feature flag in production builds. When enabled, it loads the merchant's own self-hosted AERIS admin UI in Direct mode only. Off-host links open in the system browser.
Deep-link scheme <code>aeris://</code>	Registered but currently a no-op. Reserved for a future feature.
Two connection modes	"Direct" (LAN/on-prem) and "Relay" (cloud). Both are first-party AERIS infrastructure. Switch in Settings.
Biometric / PIN	Optional. PIN can be reset from Settings → Reset PIN. Persists across explicit logout (cleared by "Remove account from this device").
